

## How to Setup WizHR under Terminal Services

1. Setup WizHR client on the server. This MUST be done at the server console and not through Terminal Services or RDP.
2. Log into Wizhr and verify WizHR is functioning correctly
3. Go to a Client PC where WizHR is functioning correctly.
4. Locate the following files:  
**Person.ini**  
**Wizcent.ini**  
By default these files are in the users windows folder.
5. Copy them onto the **server**, into the windows folder, overwriting the ones that already exist there.
6. Each users set up on the server has a windows directory under their “Document and Settings” folder.(ON THE SERVER)
7. Copy the 2 files above into each users windows folder on the server.
8. Locate the folder that contains WizHR.exe on the server (\wizapp\client\wizhr)
9. Create a subfolder for each user you wish to use WizHR e.g  
**\wizapp\client\wizhr\user1**
10. Copy the Files in the folder containing Wizhr.exe into each of these sub folders.
11. Create a shortcut on each user desktop to their copy of WizHR.exe.

Run terminal services and each user will now have a unique instance.
